

MIX CUT^{PRO}

MIX CUT

Brand: ProLab

Pharmaceutical Form: Injectable solution

Presentation: 10 ml vial

Total Concentration: 500ml/mg concentrated vial of 10 ml

COMPOSITION:

Trenbolone Enanthate (150 mg): Renowned for its potent anabolic capacity, Trenbolone Enanthate is essential for increasing muscle strength and lean mass. In addition, it helps reduce body fat while improving muscle density, and optimizes recovery between training sessions.

Drostanolone Enanthate (150 mg): A popular steroid in cutting cycles, Drostanolone is known for its ability to improve muscle hardness and reduce adipose tissue, contributing to a more defined and dry physique, with minimal water retention.

Testosterone Decanoate (100 mg): Provides a sustained release of testosterone, maintaining stable hormonal levels during the cycle. This testosterone base is essential for maintaining vitality, libido and overall performance while enhancing anabolic effects.

Phrylpropioiat (100mg): A fast-acting propionate ester, ideal for those who want to see results from the first few weeks of the cycle. It boosts the initial phase of the cycle, facilitating increases in strength and muscle mass without water retention.

THERAPEUTIC INDICATIONS:

Mix Cut Pro is designed for experienced users looking for a complete cutting cycle, optimized for muscle definition, strength gains and fat reduction. It is especially suitable for pre-contest phases, where preservation of lean mass and fat loss are paramount, all while minimizing water retention.

This product is ideal for those who want to optimize their cycle without the need for multiple injections, as the mix covers all the essential aspects of an effective cutting cycle: improved muscle quality, increased strength and reduced body fat.

RECOMMENDED DOSAGE:

Intermediate Users: A dosage of 500mg per week is recommended, administered in two 250mg injections, ensuring a steady release of the compounds and maintaining stable levels in the body.

Advanced Users: Depending on personal tolerance and goals, the dosage can be increased to 750mg weekly. However, it is essential to closely monitor side effects and adjust the dosage according to the body's response.

Since Mix Cut Pro contains medium and long-acting esters, it has a gradual release that allows for cycles ranging from 8 to 12 weeks. Users can benefit from long-lasting effects throughout the cycle, but it is essential to follow a Post Cycle Therapy (PCT) protocol to restore endogenous testosterone production once the cycle is over.

Warning for Women: Due to the androgenic potency of the compounds present in Mix Cut Pro, it is not recommended for women, as it may cause virilizing side effects, such as facial hair growth and voice changes.

MODE OF ADMINISTRATION:

The injectable solution should be administered by deep intramuscular injection, preferably into large muscles such as the glutes or quadriceps. It is important to rotate injection sites to avoid local irritation, nodule or abscess formation. Strict hygiene must be followed during the injection process to prevent infection.

CONTRAINDICATIONS:

Mix Cut Pro is contraindicated in people with severe liver, kidney or heart disease. Its use should also be avoided in individuals with uncontrolled hypertension, prostate problems or in those who are sensitive to any of the components of the formula. This product is not recommended for women, due to the risk of significant androgenic side effects.

It is essential that Mix Cut Pro is administered under the supervision of a health professional and that periodic evaluations are carried out to monitor any adverse effects or hormonal imbalances that may arise during the cycle.
