

Decax (Nandrolone Decanoate)

Brand: ProLab

Pharmaceutical Form: Injectable Solution

Presentation: 300ml/mg concentrated vial of 10 ml

COMPOSITION:

Each ml of Decax contains 200 mg of nandrolone decanoate, an anabolic steroid widely known for its potent ability to promote muscle growth and nitrogen retention in the body. Nandrolone has a long half-life and a low tendency to aromatize, making it a preferred choice for bodybuilders looking for quality muscle mass with lower water retention and reduced estrogenic side effects.

Nandrolone is a mild anabolic in terms of androgenic side effects, making it a suitable choice for extended bulking cycles, providing consistent and sustainable muscle gains, with less risk of hormonal side effects compared to other steroids.

THERAPEUTIC INDICATIONS:

Decax is primarily indicated for users looking for a significant increase in lean muscle mass and a noticeable improvement in muscle recovery. It is ideal for athletes who want clean bulking cycles or for those who are in recovery processes due to injuries, as nandrolone is also known for its ability to strengthen joints and connective tissues.

This compound is also widely used due to its ability to increase nitrogen retention in the muscles, allowing for increased protein synthesis and therefore enhanced muscle growth. Additionally, Decax has been shown to be effective in improving bone density, which is an added benefit in long-term cycles.

RECOMMENDED DOSAGE:

The standard Decax dosage for men ranges from 300-600mg per week, depending on the user's level of experience and goals. Beginners typically start with 300mg per week, while more advanced users can increase the dosage to maximize muscle growth. Due to its decanoate ester, Decax is administered once a week, as its long half-life allows for stable levels to be maintained in the body.

In women, due to its relatively low androgenic nature, the recommended dosage is between 50-100mg per week. However, special care should be taken to monitor signs of virilization such as body hair growth and voice changes, adjusting the dosage if necessary.

Decax cycles typically last between 10-12 weeks, as nandrolone takes time to show its full anabolic effects, but once it does, it offers sustainable muscle gains. It is commonly used in combination with other compounds such as testosterone to achieve better results in terms of mass and strength.

MODE OF ADMINISTRATION:

Decax is administered via deep intramuscular injection, usually in large areas such as the glutes or quads. Due to the nature of its decanoate ester, injections can be performed weekly, reducing the frequency of applications and improving user comfort during extended cycles.

Once injected, Decax is released slowly and steadily into the body, allowing stable nandrolone levels to be maintained for several days. This gradual release minimizes hormonal spikes and dips, contributing to more balanced muscle growth and better retention of gains upon cycle completion.

CONTRAINDICATIONS:

Decax is contraindicated in individuals with a history of severe liver disease, prostate or breast cancer, or severe kidney problems. It is also contraindicated in individuals with a known hypersensitivity to nandrolone or any component of the product. It is not recommended for use in pregnant or breastfeeding women.

Users with a predisposition to baldness, gynecomastia, or prostate problems should be cautious when using Decax, as although it has a low tendency to aromatize, it can still cause some unwanted side effects in susceptible individuals.
