

NUTRA (Ibutamoren 10mg)
Brand: ProLab
Pharmaceutical Form: Capsules
Presentation: Package with 100 capsules of 10 mg each

COMPOSITION:

NUTRA contains Ibutamoren (MK-677), a growth hormone secretagogue that simulates the action of ghrelin, which stimulates the secretion of growth hormone (GH) and increases insulin-like growth factor type 1 (IGF-1) levels in the body. Unlike traditional anabolic steroids, MK-677 is neither a steroid nor an androgen receptor modulator (SARM), so it does not suppress natural testosterone production, making it a safe option for users concerned about hormonal balance.

Using NUTRA can promote muscle growth, improve tissue regeneration, and speed up recovery without the side effects of steroids or SARMS. Additionally, it has a positive effect on sleep quality, which reinforces the body's ability to regenerate after intense workouts.

THERAPEUTIC INDICATIONS:

NUTRA is indicated to promote lean muscle mass gains, improve tissue quality, increase strength, and speed up muscle recovery in athletes and bodybuilders. Thanks to its ability to increase GH and IGF-1 levels, it is an excellent choice for those seeking better physical regeneration and recovery without compromising their endocrine health.

It is especially useful in bulking phases or when the goal is to improve body composition without resorting to anabolic compounds that affect the hormonal system. Its ability to improve nitrogen retention and stimulate appetite also makes it a valuable supplement for individuals who have difficulty consuming enough calories.

RECOMMENDED DOSAGE:

The recommended dosage of NUTRA is 10-25 mg daily, depending on the user's goals. For beginners, a dosage of 10-15 mg daily is usually sufficient to see improvements in muscle mass, recovery, and sleep. Intermediate and advanced users may opt for dosages of 20-25 mg daily, especially during bulking or intensive recovery phases.

A cycle of 8-12 weeks is recommended, with an appropriate break at the end of the cycle to allow the body to maintain the benefits and stabilize GH and IGF-1 levels. Being a growth hormone secretagogue, MK-677 can be used for longer cycles without the risk of liver toxicity or severe hormonal suppression.

ADMINISTRATION MODE:

NUTRA should be taken orally, and the capsules should be swallowed with an adequate amount of water. Due to its long half-life, it is recommended to take the daily dose in a single dose, preferably at night before sleep, to maximize the secretion of growth hormone during sleeping hours.

For those looking to improve sleep quality and muscle regeneration, it is ideal to take NUTRA about 30-60 minutes before bedtime. If the goal is to maximize daytime performance, it can be administered during breakfast or a meal rich in healthy fats to improve its absorption.

CONTRAINDICATIONS:

NUTRA is contraindicated in individuals with known hypersensitivity to Ibutamoren or any of the excipients in the formula. It should not be used in individuals with medical conditions that negatively affect growth hormone metabolism, such as those with active tumors, as increased GH levels could accelerate the growth of unwanted cells.

It is also contraindicated in pregnant or breastfeeding women, due to the lack of studies on the effects of MK-677 on fetal development and infant health. It should also be avoided in patients with endocrine problems or uncontrolled diabetes, as Ibutamoren may raise blood glucose levels and alter insulin sensitivity.
